Four climate change-focused pilot projects report final outcomes

The University of Washington Population Health Initiative announced the award of four, \$50,000 [climate change-focused pilot grants](#) in autumn 2023.

These awards were intended to support interdisciplinary teams of researchers to develop preliminary data or proof-of-concept needed to pursue follow-on funding to scale work in areas such as promising advances in sustainable materials and aiding cities to achieve net-zero emissions. Each applicant for these pilot grants was previously awarded a [climate change planning grant](#) to support project planning during summer quarter 2023.

All four projects have now completed, with project findings described in the following tabs.

Sustainable metamaterials for insulation applications

Wild food plant diversity, conservation, and community knowledge in the Eastern Mediterranean

DecarbCityTwin: A Platform for Equitable Decarbonization of the Built Environment

Assessing the Benefits of Community Photovoltaic Power Projects in Washington

More information about the Population Health Initiative pilot grant program can be found by visiting our [funding page](#).

WHAT IS POPULATION HEALTH?

Population health is a broad concept encompassing not only the elimination of diseases and injuries, but also the intersecting and overlapping factors that influence health.
